

Project 01: Elements of Nature (Shell formations)

This project aims for designing a shell structure that creates an opened enclosure from simple materials of wooden sticks. The goal of the project is to establish a general structural sense of objects by driving the concepts of the designs from natural elements, such as a seashell or bird wing. The students will start the project by analyzing the suggested elements, and then they will use basic abstraction methods to apply the formative and structural aspects into their 3D stick model.

Project 02: Folded & Animated Planes

The aim of this project is to introduce students to deal with Planes, which define the boundary of a space. Spaces can be characterized by coloring or animating two-dimensional planes. Floors, walls, doors, windows and other similar architectural elements are nothing but two-dimensional planes enclosing precious space between them.

Project 03: Positive and Negative Composition

This Project aims for designing a three dimensional composition within a specified space. The composition must reflect the student understands of the relationship between solid masses and voids; it must also reflect the abilities of creating enclosures, hierarchy, and rhythm by using the negative and positive spaces.

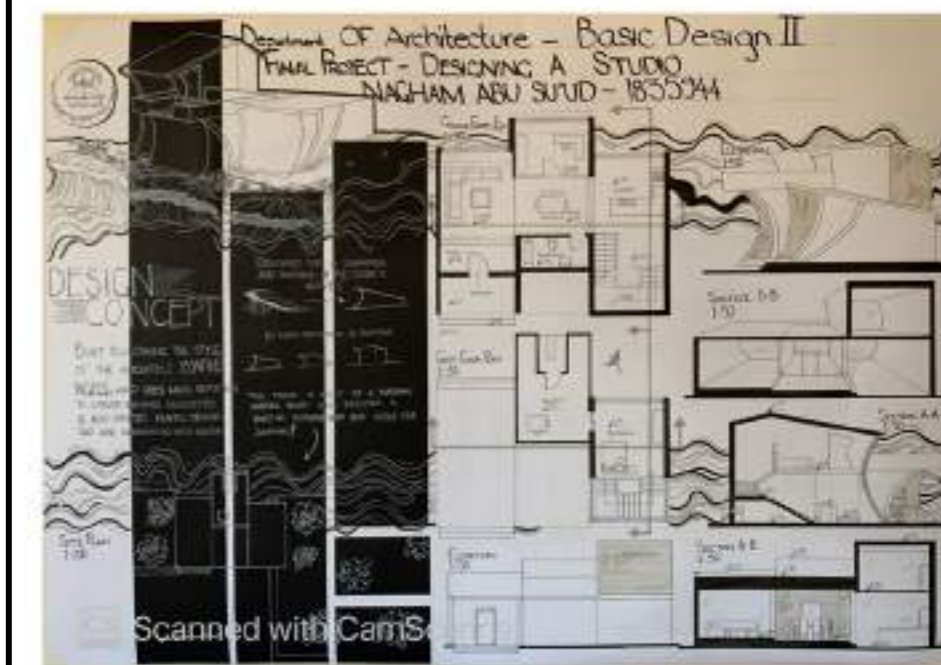

Project 04: Kiosk Design

This Project aims for designing the kiosk, it is to have an area of 30m2, including the following; coffee shop bar and mini market goods stands. Besides an outdoor sheltered setting area.

Project 05: Final Project (Studio Design)

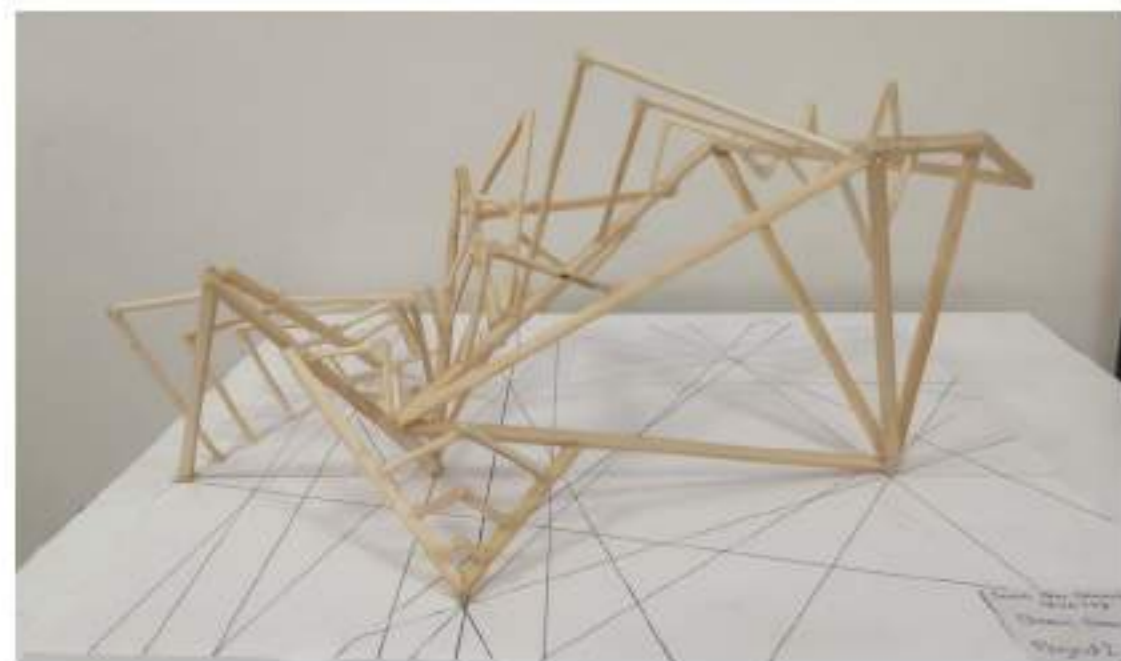

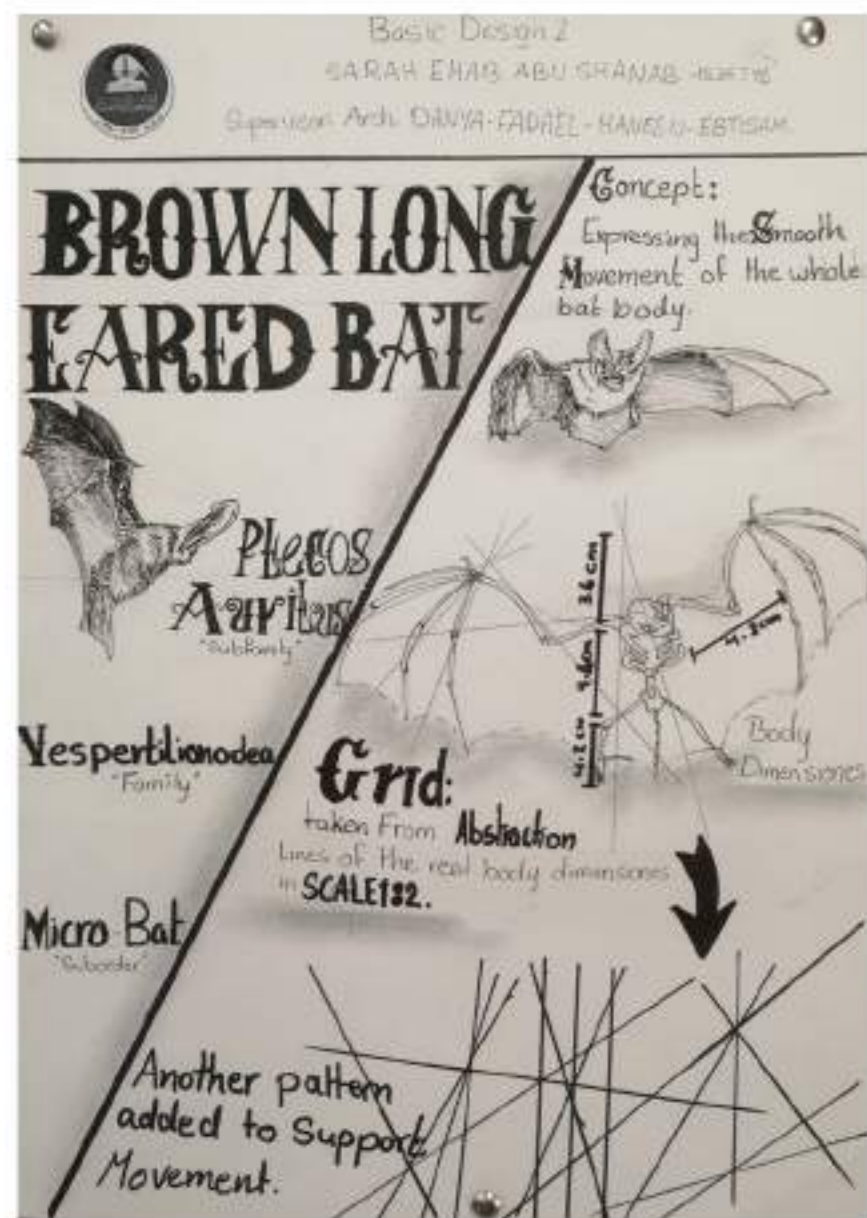

This Project aims to help students to acquire a solid foundation of knowledge pertaining to the primary goal of design; that is being able to create well-established 2-d and 3-d compositions that possess all qualities of excellent visual aesthetics. A building is a composition that balances between multiple needs; it deals with function, structure, building technology, cost and aesthetics.
