ARCH222: Course Name ARCHITECTURAL DESIGN II

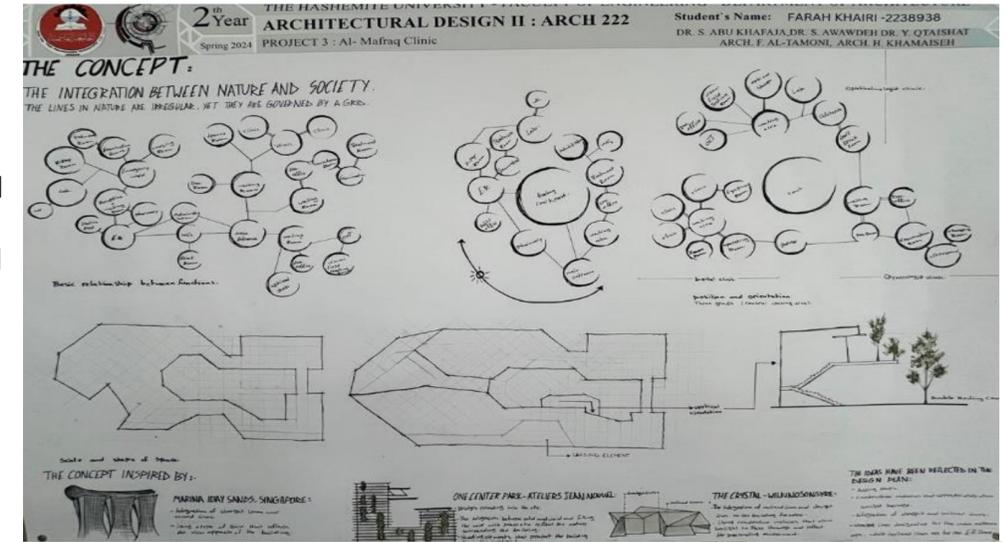

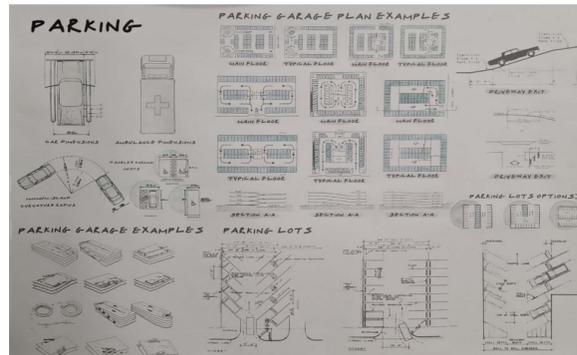

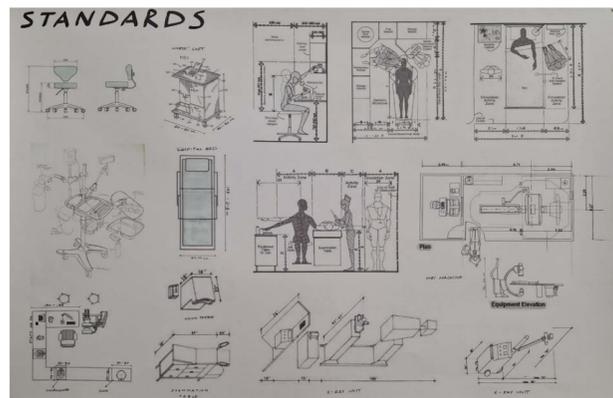

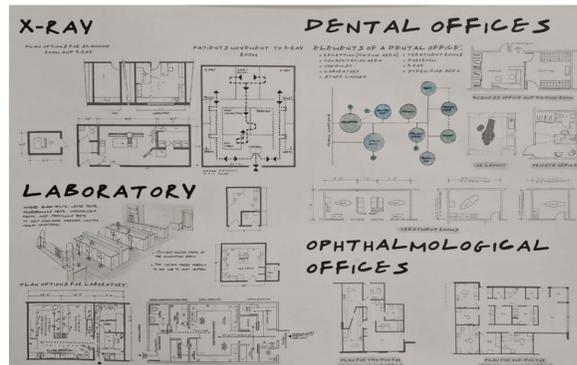

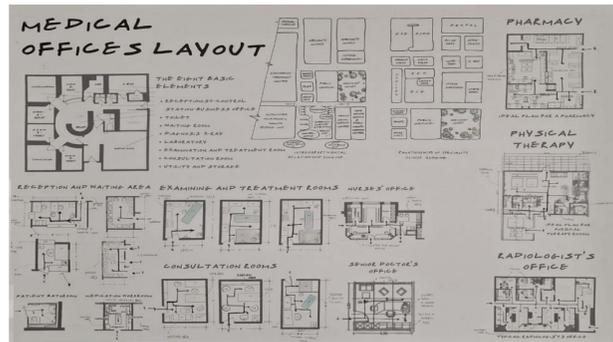

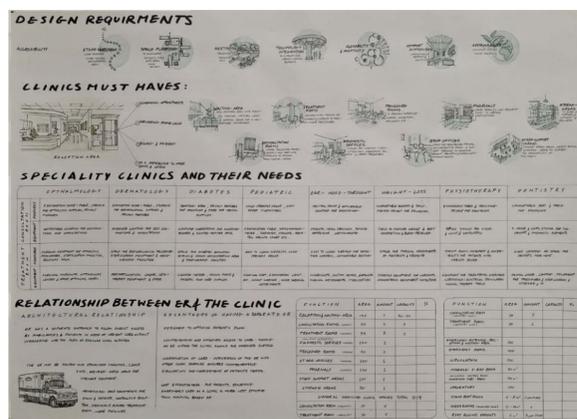

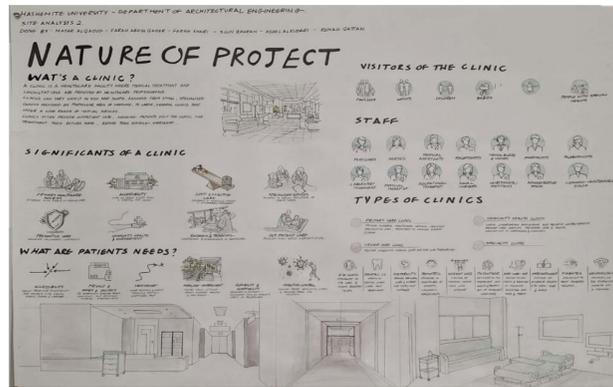

Instructors: Dr. Shatha Abu-Khafajah , Dr. Siba Awawdeh, Dr. Yahia Qutieshat, Arch. Haneen Khamaiseh, Arch. "Fadael Al-Rahman"

SPC: A6-B4

Project Title : Al- Mafraq Clinic

St. Name: Farah Khayri

Project Description: A medical clinic is a healthcare facility that primarily focuses on providing outpatient services to patients. "Outpatient" refers to medical care that does not require an overnight stay at the clinic. This means that patients can return to their homes after receiving medical attention. Medical clinics can be owned and operated by the government, private organizations, or publicly. They are designed to provide healthcare services that are geared towards routine medical care, preventive care, and medical attention for minor illnesses. Patients are often required to schedule an appointment before visiting a medical clinic. However, some clinics may also accept walk-ins. Medical clinics offer a wide range of healthcare services, including general medical care and specialized treatments, depending on the nature of the clinic. Specialized clinics provide specialized services to patients who may require more focused care. The medical professionals who work in a clinic depend on the specific facility and the services they offer. The healthcare professionals you may encounter at a medical clinic include primary care doctors, specialized doctors such as gynecologists, cardiologists, or dermatologists, physician assistants, nurse practitioners, registered nurses, mental health professionals such as psychologists, psychiatrists, or social workers, and physical therapists. By providing specialized care and services, medical clinics aim to meet the unique healthcare needs of patients, while ensuring that they receive the highest quality of healthcare possible.
